## Interventions for children on the autism spectrum

### A synthesis of research evidence

Interventions for children on the autism spectrum:  
A synthesis of research evidence

A landmark report for families, clinicians, researchers and policy makers

Autism CRC has published a report for families, clinicians, researchers and policy makers, which synthesises all available high-quality evidence about interventions for children on the autism spectrum.

Evidence shows that effective intervention during childhood plays an important role in promoting learning and participation in everyday life activities. However, navigating the range of interventions can be difficult.

The report, [Interventions for children on the autism spectrum: A synthesis of research evidence](#) (Autism Interventions Evidence Report), provides families and clinicians the best opportunity to make informed decisions when choosing interventions. It includes a broad overview of intervention for children on the autism spectrum, including the principles underpinning all interventions, and the rationale behind each category of intervention. The report also includes a comprehensive review of the scientific evidence for the effects of interventions for children on the spectrum, both therapeutic and otherwise. The evidence review was conducted to international best-practice standards, including only the highest quality of evidence. The report was commissioned by the National Disability Insurance Agency and completed by Autism CRC through the work of a research team with a diverse range of professional backgrounds.

[Register to access the full report](#)

### Community summaries

We have prepared community summaries for the two reviews contained within the Autism Interventions Evidence Report:

- Community summary 1:  
[Interventions for children on the autism spectrum, and their application in the Australian community \(Narrative review\)](#)
- Community summary 2:  
[A review of evidence for interventions for children on the autism spectrum \(Umbrella review\)](#)

### Interventions for children on the autism spectrum

# Acknowledgment

Project Team: Kandice Varcin, Hannah Waddington, Rhylee Sulek, Cathy Bent, Andrew Whitehouse, David Trembath, Jill Ashburner, Emma Goodall, Valsa Eapen, Kristelle Hudry, Jacqui Roberts, Natalie Silove.

Consultation: Dr Cindy Stern, Joanna Briggs Institute, University of Adelaide.  
Michelle DuBroy and Bonnie Dixon (Librarians, Griffith University)

- Peter De Natris, Lisa O'Brien and teams (NDIA)
- Andrew Davis, Cally Jackson, Jason Kotzur (Autism CRC)

Children and families who were the original participants of the research included in this synthesis.

# Declaration of interests

- The Team: All members of the project team received a salary contribution or honorarium to support our work on the review. A full list of disclosures is available via the Open Science Framework registration <https://osf.io/jxpg4/>
- Presenters: David has been involved in university programs that train health professionals, has received state and federal government research funding, has published research in this area, has received honoraria for professional services, holds positions on committees relevant to practice, and has family members who receive NDIS funding.
- Emma has been involved in university programs that train education professionals, holds a position in a federally funded organization that produces education around autism for families and schools, has had responsibility for autistic students within state education departments including policy development and implementation, has published research and books in this area, holds positions on committees relevant to practice, and is autistic.

# Acknowledgement of perspectives and preferences

The project team and presenters warmly acknowledge the diverse community perspectives and preferences in relation to understandings of autism; language and terminology; and the relevance and role of interventions, therapies, supports, services at individual, community, and societal levels in the lives of individuals and their families.

We seek to work in ways that unite us all in a commitment to upholding the human rights, dignity, choice, and preferences of the children and families who are the focus of this work.

# Webinar overview

The need	What we did	What it means
To improve access to evidence-based interventions and supports	Introduction to context, aims, and scope of the review (Chapter 1)	Insights based on personal expertise (Dr Emma Goodall)
To make sense of the range of interventions available and their delivery	Narrative review of interventions and training pathways (Chapter 2)	
To provide a synthesis (integrated summary) of the research evidence	Umbrella review of evidence for interventions (Chapter 3)	
To consider the next steps for practice and research	Summary of findings, limitations, and future directions (Chapter 4)	

# Context

AutismCRC

# Current clinical practice

## Why intervention?

Intervention during childhood is a significant opportunity to support early development, minimise disability and maximise each child's strengths and opportunities.

# The intervention maze

There are numerous interventions available for children on the autism spectrum

They vary in so many ways:

- Who are they designed for?
- What are the goals?
- How are they proposed to work?
- How are they used in practice
- What is the evidence?

# The challenge:

- The complexity makes it extremely difficult to:
  1. Understand theoretical and practical aspects of intervention
    - *What actually are the different interventions for children on the autism spectrum?*
  2. Select interventions that are most likely to be helpful and desired by an individual child and family
    - *How do I make an informed choice on the most appropriate intervention?*
- Both are imperative to ethical clinical practice.

# Previous reviews

1. Roberts and Prior (2006)
  - Report for DoHA
2. Prior, Roberts, Rodger, Williams (2011)
  - Report for FaHCSIA
3. Roberts and Williams (2016)
  - Report for the NDIA

Have provided insights and helped to identify core principles that should underpin clinical practice

July 2006

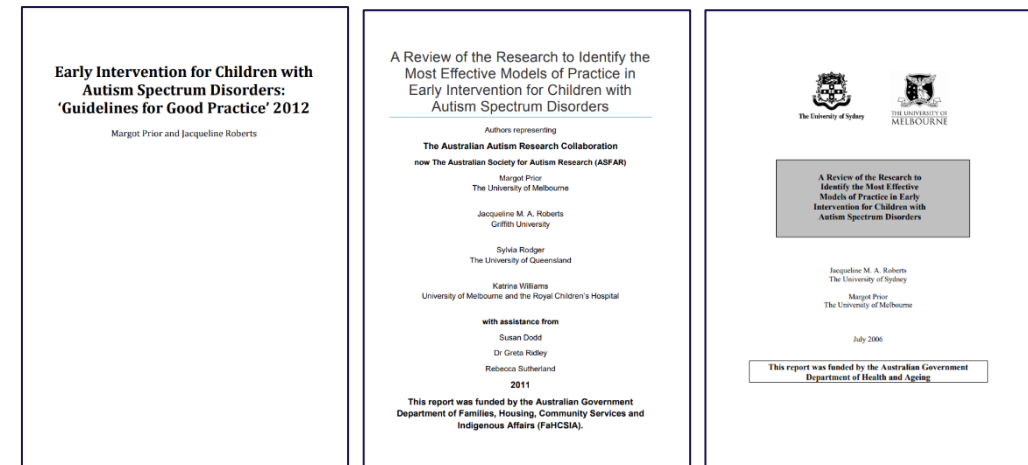

This report was funded by the Australian Government  
Department of Health and Ageing

**Table 1. Core principles that are important to interventions for children on the autism spectrum**

Core principle	Description
Holistic assessment	An initial assessment of an individual's strengths, challenges, goals, and preferences is critical to developing intervention targets that are meaningful to the child and family.
Individual and family-centred	The person on the autism spectrum, and their family members, are the individuals receiving clinical services, and are to be considered equal partners with clinical practitioners.
Lifespan perspective	The types of interventions and supports that are most appropriate will change across the life-course, as children move from early childhood settings into school, and ultimately adult life.
Evidence-based	Intervention is most effective and safe when it is based on the best available research evidence, combined with evidence from clinical practice and the preferences and priorities of fully informed children (to the extent possible) and families.

# Limitations of previous reviews

1. Were not designed to be as systematic as possible (in the scientific sense)
2. A lot has changed (e.g., understanding, intervention options, evidence)

# What did we do?

## Two aims of the report:

1. To provide an **overview** of (non-pharmacological) interventions that have been developed for children on the autism spectrum, and the **training pathways** in Australia for clinical practitioners who provide these interventions; and
2. To review the **scientific evidence** for the therapeutic (and other) effects of interventions for children on the autism spectrum

# Report structure

1. Introduction
2. Narrative review
3. Umbrella review
4. Appendices

**Warning!**

The report is long  
....but for a reason!

# Who is the report for?

- Individuals on the autism spectrum and their families
- Clinicians
- Policy makers
- Researchers

# Contribution to Evidence Based Practice

# Contribution to policy

“

There are many interventions available for children on the autism spectrum with no ‘one size fits all’. Learning about these interventions can sometimes be challenging for families, clinical practitioners and educators. One thing that is clear, is the role of parents and caregivers is as important as professionals when supporting their child’s development.

The Autism CRC’s research along with other evidence and research are being used to inform future NDIS operational guidelines, and increased transparency on reasonable and necessary supports. Some of the other considerations include:

- key principles for autism interventions
- standards for the delivery of autism interventions

”

AutismCRC

Research  
evidence

Evidence-based  
practice and policy

Optimal child and  
family outcomes

# Reflecting on:

## The context for the report

(Dr Emma Goodall)

- Significant numbers of children diagnosed autistic, at a young age
- Early intervention thought to enable improved life outcomes
  - Medical model vs social model
- Myriad interventions offered, hard to choose
- Ethically important to research the evidence base for interventions
  - Effective?
  - What for?
  - Who for?
  - Over what time?

# Narrative Review

Making sense  
of the range of  
interventions

# Narrative review

Addresses the following questions:

1. What is an appropriate method for **categorising** the broad range of interventions for children on the autism spectrum?
2. What are the **theoretical premises** underpinning different intervention categories, and the principles guiding their practical application?
3. What **clinical competencies** are typically required in the Australian context to deliver the interventions described in this report?

# First things first: Terminology

**Table 3.** Terms used to classify intervention activities in the current report along with an example of the classification system.

Term	Description	Examples
Category	One or more practices that share similar theoretical underpinnings.	Behavioural interventions
Practice	A combination of techniques evaluated and implemented together to target the acquisition of one or more skills.	Early Intensive Behavioural Intervention, Discrete Trial Training, the Picture Exchange Communication System
Technique	A discrete clinical strategy, targeting the acquisition of a discrete skill.	Prompting, modelling, shaping, reinforcement

# Categorising interventions

## The issue:

- There are numerous interventions
- There is no universal system for categorising these
- There is a great deal of overlap

## The impact:

- This has created a maze for parents, practitioners, researchers, and policy makers, ultimately impacting children

## Table 2. Overview of intervention categories

Category	Proposed primary reason that the intervention may help support development of children on the autism spectrum
Behavioural interventions	Children learn new skills, mainly based on the outcomes of their behaviours as they interact with other people and the environment.
Developmental interventions	Children learn new skills through developmentally-appropriate interactions with other people and the environment.
Naturalistic developmental behavioural interventions	Children learn new skills through developmentally-appropriate interactions with other people during play and daily routines, including the outcomes of their behaviour.
Sensory-based	Learning can be enhanced by changing how children process sensory stimuli.
Technology-based	Technology use may complement the behavioural characteristics of children, thus supporting learning and participation.
Animal-assisted	Human-animal interactions may be particularly motivating and provide a context for learning and improved wellbeing.
Cognitive behaviour therapy	People can learn to identify and replace unhelpful thoughts, and their associated behaviours, leading to positive effects on emotions and behaviour.
TEACCH	Children learn new skills most effectively when learning tasks and environments are adapted to their learning characteristics.
Other	There are a variety of other interventions that do not align directly with the features of the other specific categories.

# Narrative review

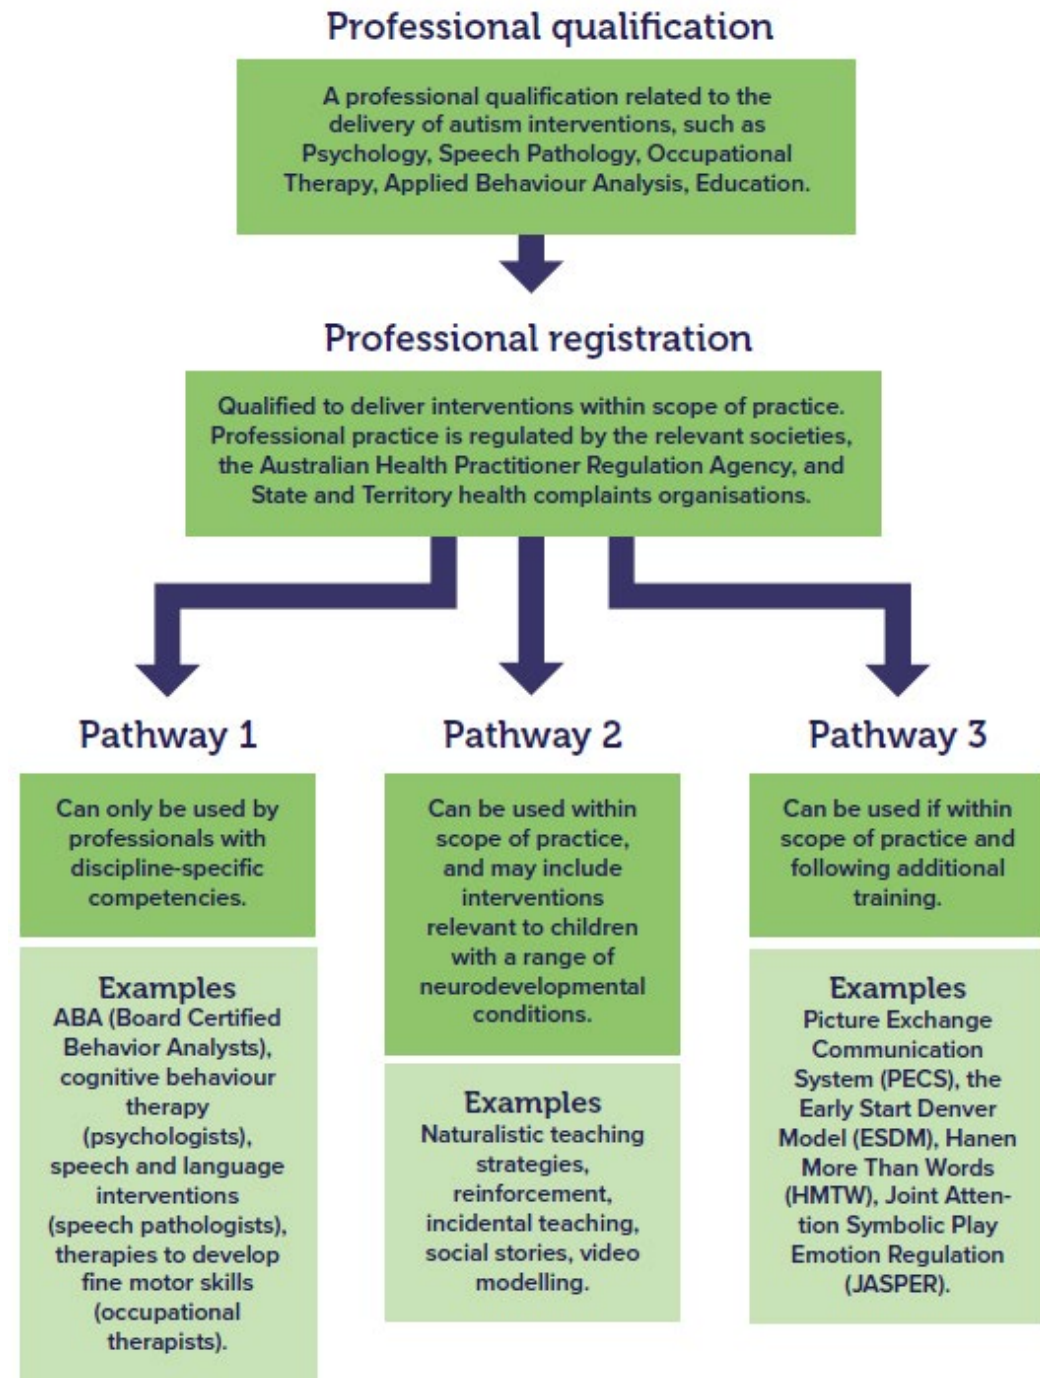

## **For each we describe:**

1. Theoretical premise
2. Clinical application
3. Principles underpinning their clinical use

# Clinical competencies

- It is not intuitive how clinicians get trained to deliver interventions
- This creates confusion in the community
- Making this clearer is an ethical imperative

Professional training pathways typically required to deliver interventions for children on the autism spectrum in Australia.

Reflecting on:

## The range of interventions and their delivery

(Dr Emma Goodall)

AutismCRC

- Different names for the same and for different interventions
  - what does it all mean?
- Not all interventions covered
  - Why is there so little/much research?
- Delivery styles and types;
  - individual, small group, large group, targeted, generic etc

# Umbrella Review

Making sense  
of the research  
evidence

**The context:** There is rapidly growing body of research studies

Study 1

Study 2

Study 3

Study 4

Study 5

AutismCRC

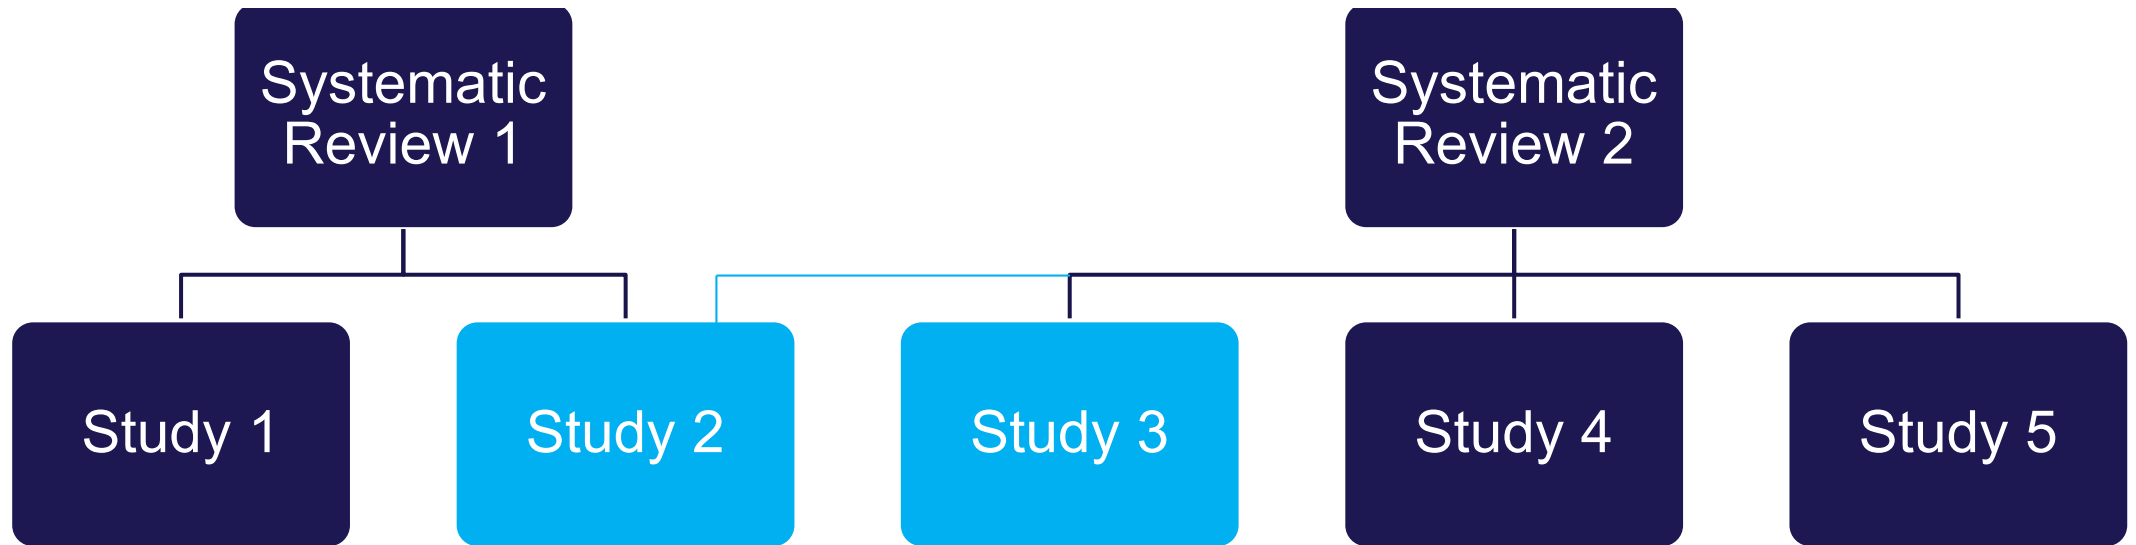

**The context:** And an increasing number of systematic reviews of individual studies

**The challenge:** But the systematic reviews differ in terms of focus, quality, and methods used

**The challenge:** And sometimes they overlap in terms of the studies they include

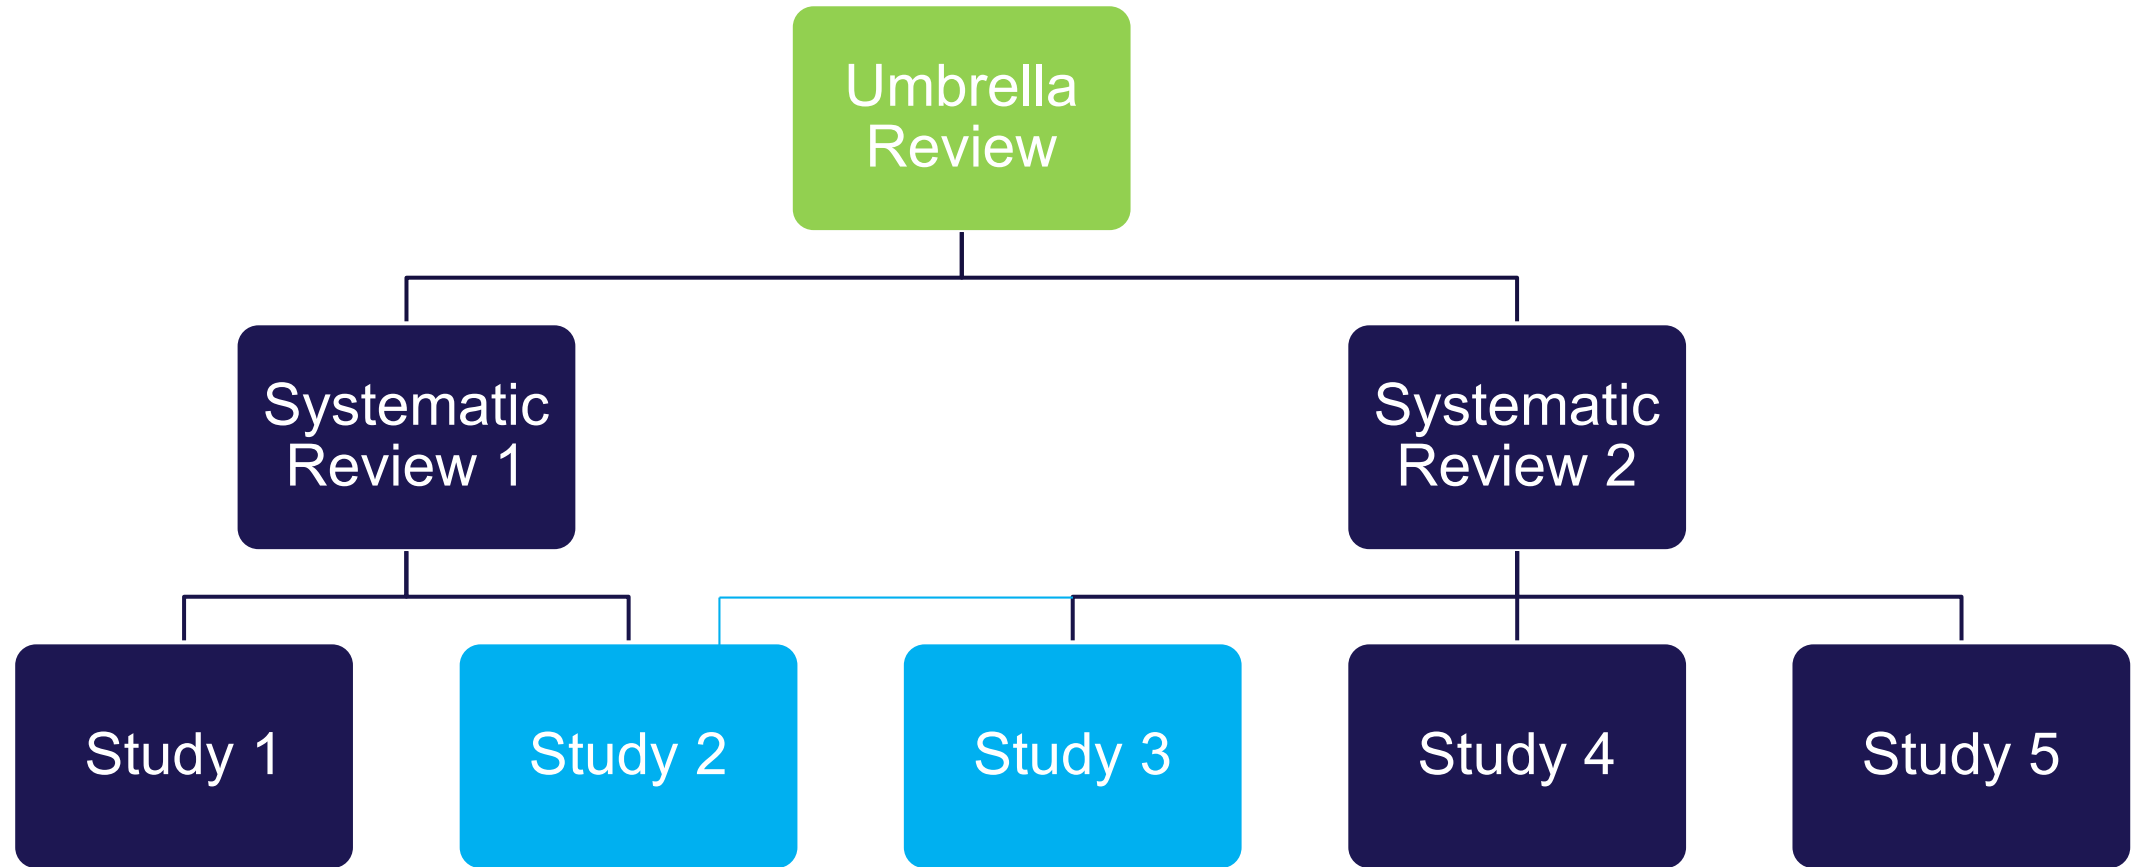

**The challenge:** How do we make sense of the different findings?

**The solution:** An umbrella review synthesises evidence from a range of systematic reviews

# Umbrella review

- A systematic review of systematic reviews
  - Provides a method of combining and synthesizing findings
- Particularly suited to:
  - Providing summary outcomes in a broad field of enquiry
  - Linking summary outcomes to policy

# Umbrella review – research questions

- **Question 1:** What non-pharmacological interventions have been examined in SRs?
- **Question 2:** What effects do non-pharmacological interventions have on child outcomes?
- **Question 3:** What effects do non-pharmacological interventions have on family wellbeing?
- **Question 4:** What are the optimal delivery characteristics of non-pharmacological interventions, with a focus on the amount of intervention, setting, format, agent, and mode?
- **Question 5:** What child characteristics influence intervention effects, with a focus on child age, core autism characteristics, cognition, and communication skills?

# The process

Determine  
parameters of  
literature search

Conduct the  
search

Identify the  
relevant studies

Extract the data

Collate, combine,  
synthesise

## Ensuring rigor and transparency

Pre-registration on

quality, every  
piece of data in  
report checked by  
at least two  
researchers, 388  
pages of  
appendixes  
presenting data

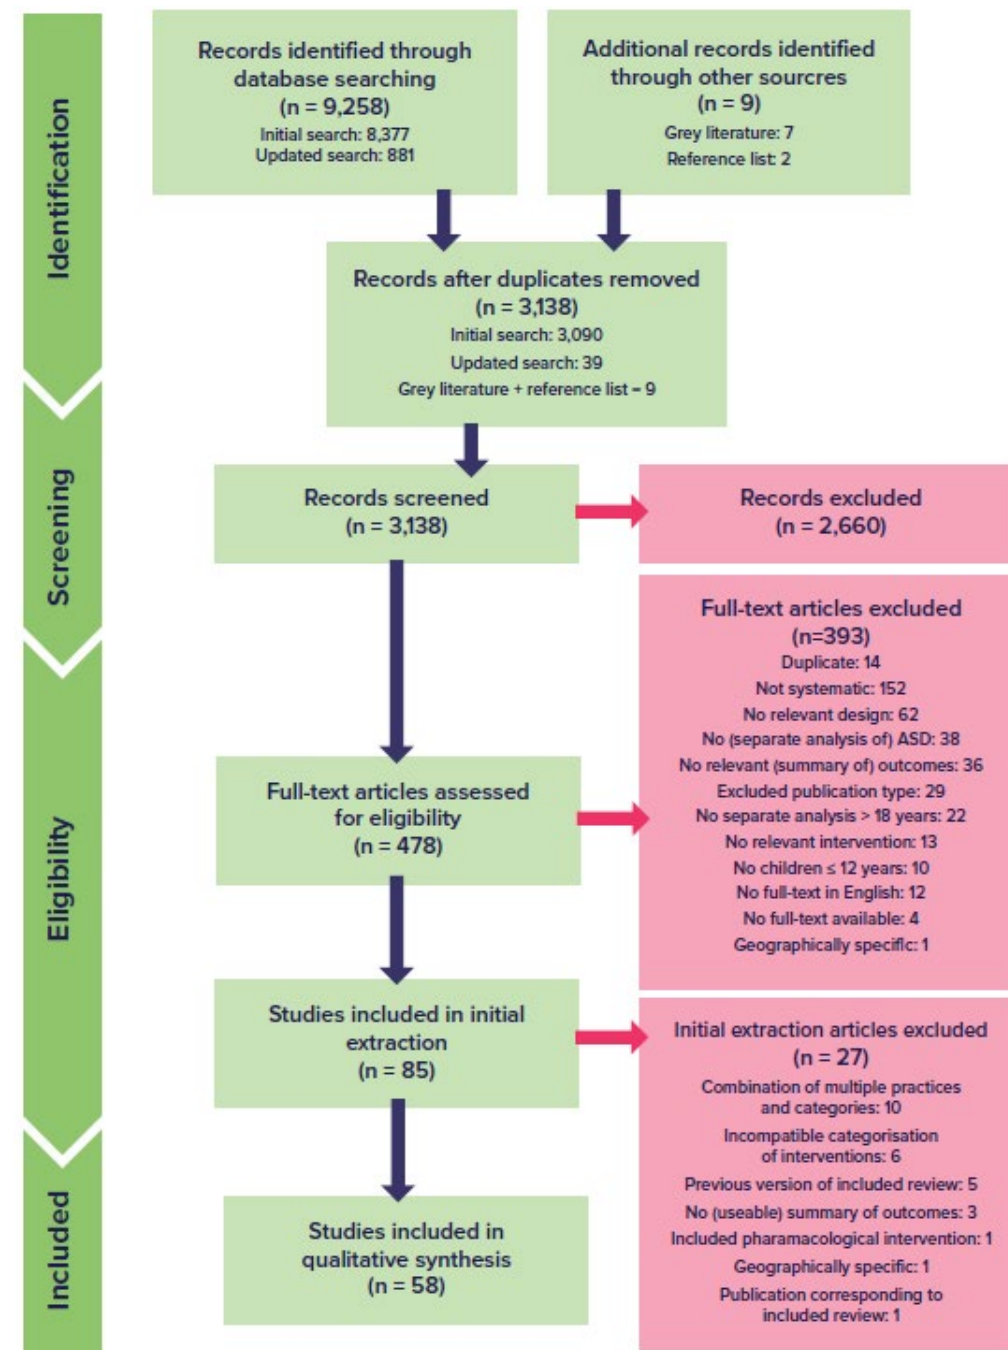

AutismCRC

# Eligibility criteria (summary, see report)

- Be a **systematic review** (with or without meta-analysis)
- include children on the autism spectrum **aged 0-12 years**
- report on at least one **non-pharmacological intervention** relevant to the categories described and target the acquisition or development of educational skills
- include **at least one** RCT, quasi-RCT, and/or controlled clinical trial
- report summarised quantitative data on the impact of the intervention on **child and family outcomes of interest** including any adverse effects
- be in a **peer-reviewed journal or as a publicly available scientific report** with a full-text copy available in the English language.

# Study selection

- 9,267 records retrieved
- 3,138 records screened
- Full text review for 478 systematic reviews
- 58 systematic reviews included

# Question 1

- What non-pharmacological interventions have been examined?
  - 58 systematic review, which drew on data from 1787 articles
  - At least 111 intervention practices across 9 categories

# Umbrella review – Question 2 and 3

- What effects do non-pharmacological interventions have on child outcomes?
- What effects do non-pharmacological interventions have on parent/caregiver outcomes?

# The findings are presented in table 6 in the report

	Interventions	No. of systemic reviews	Core autism characteristics				Related skills and development								Education and participation				Family wellbeing

L = Low quality

M = Moderate quality

H = High quality

## Findings in brief (see table 6 in report)

- Evidence indicated positive therapeutic effects for Behavioural interventions, Developmental interventions, NDBIs, Technology-based interventions, and CBT on a range of child and family outcomes.
- Positive effects for Sensory-based interventions were reported for certain practices only and were limited to select child and family outcomes.
- A mix of inconsistent and null intervention effects on child and family outcomes were reported for TEACCH and Animal-assisted interventions.

# Umbrella review – Question 4

What are the optimal delivery characteristics of non-pharmacological interventions, with a focus on intervention dosage, setting, format, agent, and mode?

**Findings in brief** (see tables 8 and 9 in report)

- Minimal data available
- Where data were available, effects were inconsistent or null, including for the amount (e.g., total hours, duration, intensity)

# Umbrella review – Question 5

- What child characteristics influence intervention effects, with a focus on child age, core autism characteristics, cognition, and communication skills?

**Findings in brief** (see Table 10 in report)

- Minimal data available
- Where data were available, effects were inconsistent or null

# Reflecting on:

## The evidence for interventions

(Dr Emma Goodall)

AutismCRC

- Who did the study/how was it funded?
  - Conflicts of interest
- Quality of evidence?
  - Reproducibility
  - Disclosure of unintended side effects
  - Hierarchy of research types
- Difficulty with generalising evidence for an intervention across the diversity of the autism spectrum
  - We are all so different, what works for one may not work for another

# Implications and next steps

# In a nutshell:

- What could we answer?
  - What interventions have a positive effect on which outcomes.
- What could we not answer?
  - Which interventions have a positive effect on which outcomes, for which children?

# Identified gaps

- Few studies reported on the effect of interventions on:
  - Children's education, participation, and quality of life
  - Caregiver outcomes including family well being
- There has been a lack of attention in systematic reviews to potential adverse effects

# Clinical Implications

The findings re-affirm that

- There is **no single best intervention for all children** on the autism spectrum.
- **No intervention** has been demonstrated to effectively target **all** child and family outcomes examined in this review, including optimised education, community participation, and quality of life.
- Interventions vary considerably in terms of the **total number of child and family outcomes** addressed for which they promote positive effects.
- There is a **concerning lack of reporting of adverse effects** in the literature to date, including null or negative findings.

# Next steps

A clinical guideline for practice, to complement the diagnostic guideline

# Reflecting on:

## Implications and next steps

(Dr Emma Goodall)

AutismCRC

- Interventions that are currently offered may not be evidence based or useful
  - Barrier to improved life outcomes
  - Waste of time/money
  - May even harm the child
- Report and tables may be hard for many to understand
  - Need an easy to read guide for families and professionals
- Lived experiences of unintended consequences of effective interventions needs researching

# Thank you!
